How the Oracle of Bacon Works Every couple of weeks the Oracle downloads every English-language article from Wikipedia. Using an open-source script, we produce a JSON file with 128,000 films and 358,000 actors and actresses.. There is a database service running at all times that stores the database file in memory.

Sortowanie przez wstawianie (ang. Insert Sort, Insertion Sort) – jeden z najprostszych algorytmów sortowania, którego zasada działania odzwierciedla sposób w jaki ludzie ustawiają karty – kolejne elementy wejściowe są ustawiane na odpowiednie miejsca docelowe. Jest efektywny dla niewielkiej liczby elementów, jego złożoność wynosi $O(n^2)$

Kolejka (ang. queue) – liniowa struktura danych, w której nowe dane dopisywane są na końcu kolejki, a z początku kolejki pobierane są dane do dalszego przetwarzania (bufor typu FIFO, First In, First Out; pierwszy na wejściu, pierwszy na wyjściu).. Operacje związane z kolejką zwyczajowo nazywa się enqueue („zakolejkuj”) oraz dequeue („odkolejkuj”).

El algoritmo fue descrito en 1977 por Ron Rivest, Adi Shamir y Leonard Adleman, del Instituto Tecnológico de Massachusetts (MIT); las letras RSA son las iniciales de sus apellidos. Clifford Cocks, un matemático británico que trabajaba para la agencia de inteligencia británica GCHQ, había descrito un sistema equivalente en un documento interno en 1973.

In der theoretischen Informatik betrachtet die amortisierte Laufzeitanalyse die durchschnittlichen Kosten von Operationen in Folgen. Im Unterschied zur allgemeinen Laufzeitanalyse werden nicht nur die maximalen Kosten der einzelnen Schritte betrachtet, sondern es wird der Worst Case aller Operationen in mehreren Durchläufen des Algorithmus' analysiert. . Dies kann – beispielsweise bei ...

Dynamische Programmierung ist eine Methode zum algorithmischen Lösen eines Optimierungsproblems durch Aufteilung in Teilprobleme und systematische Speicherung von Zwischenresultaten. Der Begriff wurde in den 1940er Jahren von dem amerikanischen Mathematiker Richard Bellman eingeführt, der diese Methode auf dem Gebiet der Regelungstheorie anwandte. In diesem Zusammenhang wird auch oft von ...

Red-Black Tree is a self-balancing Binary Search Tree (BST) where every node follows following rules. 1) Every node has a color either red or black. 2) Root of tree is always black. 3) There are no two adjacent red nodes (A red node cannot have a red parent or red child). 4) Every path from a node (including root) to any of its descendant NULL node has the same number of black nodes.

O merge sort, ou ordenação por mistura, é um exemplo de algoritmo de ordenação por comparação do tipo dividir-para-conquistar..

Sua ideia básica consiste em Dividir (o problema em vários subproblemas e resolver esses subproblemas através da recursividade) e Conquistar (após todos os subproblemas terem sido resolvidos ocorre a conquista que é a união das resoluções dos subproblemas).
