The Harris Benedict Equation is a formula that uses your BMR and then applies an activity factor to determine your total daily energy expenditure (calories). The only factor omitted by the Harris Benedict Equation is lean body mass. Remember, leaner bodies need more calories than less leaner ones.

The scalar form of Laplace's equation is the partial differential equation $\nabla^2\psi=0$, (1) where ∇^2 is the Laplacian. Note that the operator ∇^2 is commonly written as Delta by mathematicians (Krantz 1999, p. 16). Laplace's equation is a special case of the Helmholtz differential equation $\nabla^2\psi+k^2\psi=0$ (2) with $k=0$, or Poisson's equation $\nabla^2\psi=-4\pi\rho$ (3) with $\rho=0$.

$E = mc^2$, equation in German-born physicist Albert Einstein's theory of special relativity that expresses the fact that mass and energy are the same physical entity and can be changed into each other. In the equation, the increased relativistic mass (m) of a body times the speed of light squared (c^2) is equal to the kinetic energy (E) of that body.

The Schrödinger equation is the fundamental equation of physics for describing quantum mechanical behavior. It is also often called the Schrödinger wave equation, and is a partial differential equation that describes how the wavefunction of a physical system evolves over time.

Logistic Equation. The logistic equation (sometimes called the Verhulst model or logistic growth curve) is a model of population growth first published by Pierre Verhulst (1845, 1847). The model is continuous in time, but a modification of the continuous equation to a discrete quadratic recurrence equation known as the logistic map is also widely used.
